Custom Signature-Based Intrusion Detection System (Python)

🛡️ Python Host-Based IDS — Portfolio Project

> 📋 Project Summary A lightweight, host-based **Intrusion Detection System (IDS)** built from scratch in Python using raw sockets. The system captures live network traffic, decodes packet headers at the binary level, and inspects payloads in real-time against an expandable signature database. Features a multi-threaded architecture, a rich color-coded alerting engine, and persistent forensic logging.

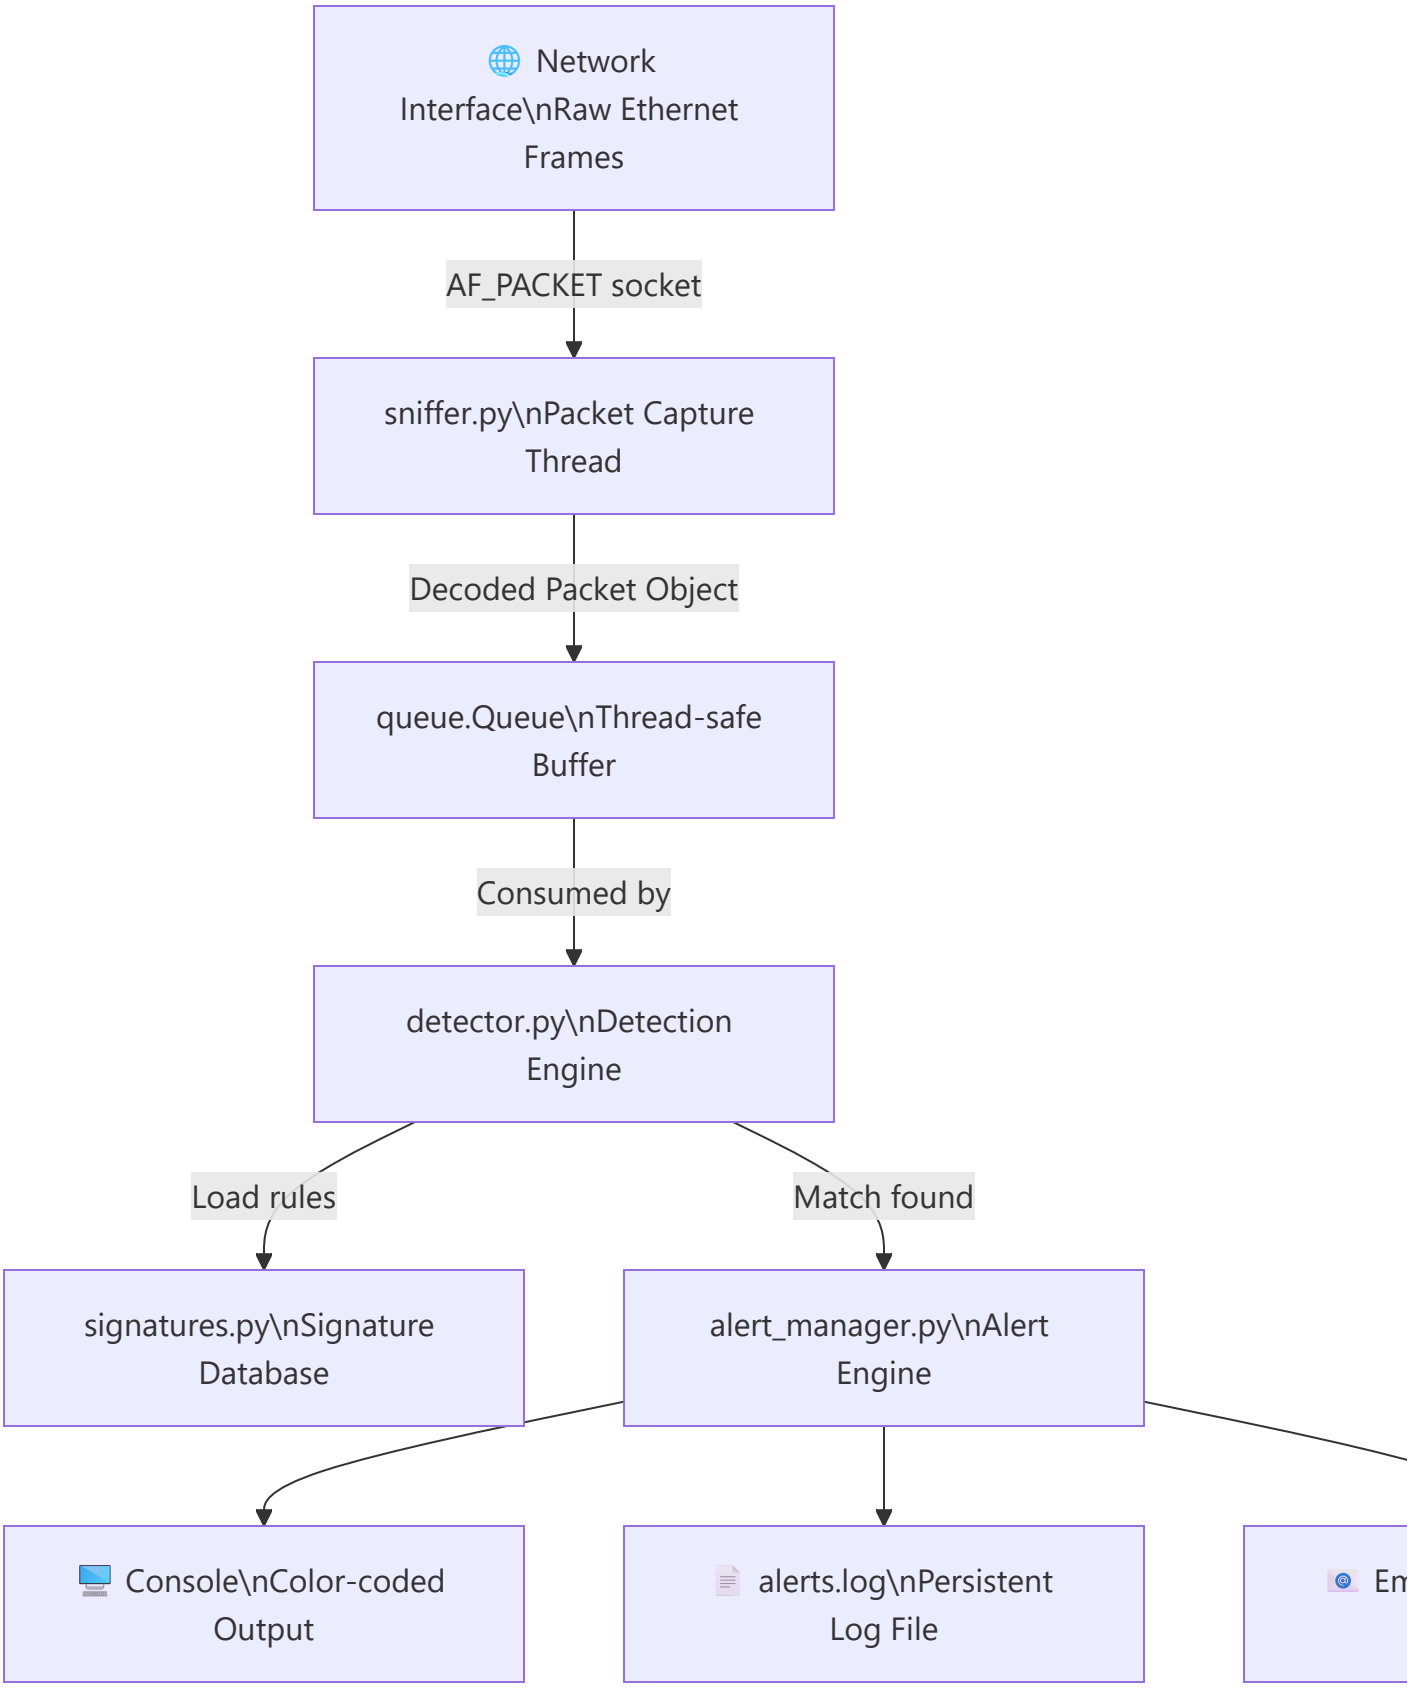
📁 Project Structure

```
ids_project/
│
├── main.py               # Entry point — starts the sniffer & alert engine
├── sniffer.py            # Raw socket packet capture & header parsing
├── signatures.py         # Attack signature database (SQLi, XSS, RCE, etc.)
├── detector.py           # Detection engine — matches payloads to signatures
├── alert_manager.py      # Alerting system — console, log file, email (optional)
├── config.py             # Global configuration (ports, thresholds, paths)
└── alerts.log            # Auto-generated persistent log file
```

🔧 Tech Stack

Component	Technology
Language	Python 3.x
Packet Capture	`socket.AF_PACKET` (Raw Sockets)
Header Parsing	`struct` (binary unpacking)
Detection	`re` (Regex) + String Matching
Threading	`threading` + `queue.Queue`
Alerting	`colorama` (console) + file logging
Encoding Bypass	`urllib.parse.unquote`

🏗️ Architecture



⚙️ 1. Configuration — `config.py`

```python
# config.py
# ──────────────────────────────────────────────
# Central configuration for the IDS.
# Modify these values to tune the system.

import os

# ── Paths ──────────────────────────────────────
LOG_FILE = os.path.join(os.path.dirname(__file__), "alerts.log")

# ── Port Scan Detection ────────────────────────
# Alert if one IP sends SYN packets to this many
# unique ports within the time window (seconds).
PORT_SCAN_THRESHOLD  = 15   # unique ports
PORT_SCAN_WINDOW_SEC = 10   # time window

# ── Brute Force Detection ──────────────────────
# Alert if one IP makes this many connection
# attempts to a watched port within the window.
BRUTE_FORCE_PORTS     = [22, 21, 3389, 23]  # SSH, FTP, RDP, Telnet
BRUTE_FORCE_THRESHOLD = 10   # attempts
BRUTE_FORCE_WINDOW    = 30   # seconds

# ── HTTP Inspection Ports ──────────────────────
HTTP_PORTS = [80, 8080, 8000, 8443, 3000]

# ── Email Alerting (Optional) ──────────────────
EMAIL_ALERTS_ENABLED = False
SMTP_SERVER   = "smtp.gmail.com"
SMTP_PORT     = 587
EMAIL_FROM    = "your_ids@gmail.com"
EMAIL_TO      = "analyst@yourdomain.com"
EMAIL_SUBJECT = "[IDS ALERT] Intrusion Detected"
# Store password in env var, never hardcode it:
EMAIL_PASSWORD = os.getenv("IDS_EMAIL_PASS", "")
```

✍️ 2. Signature Database — `signatures.py`

```python
# signatures.py
# ──────────────────────────────────────────────
```

```python
# Expandable attack signature database.
# Each entry: (rule_name, regex_pattern, severity)
#   severity: "LOW" | "MEDIUM" | "HIGH" | "CRITICAL"

SIGNATURES = [

    # ── SQL Injection ──────────────────────────
    ("SQLi: UNION SELECT",      r"UNION[\s\+]+SELECT",          "CRITICAL"),
    ("SQLi: OR 1=1",            r"OR[\s\+]+1[\s]*=[\s]*1",      "CRITICAL"),
    ("SQLi: DROP TABLE",        r"DROP[\s\+]+TABLE",            "CRITICAL"),
    ("SQLi: SELECT FROM",       r"SELECT[\s\+]+.*FROM",         "HIGH"),
    ("SQLi: INSERT INTO",       r"INSERT[\s\+]+INTO",           "HIGH"),
    ("SQLi: Comment Injection", r"(--|#|/\*)",                  "MEDIUM"),
    ("SQLi: Single Quote",      r"'",                           "LOW"),
    ("SQLi: Batch Query",       r";[\s]*SELECT|;[\s]*DROP",     "CRITICAL"),

    # ── Cross-Site Scripting (XSS) ─────────────
    ("XSS: Script Tag",         r"<[\s]*(script|SCRIPT)",       "HIGH"),
    ("XSS: onerror Handler",    r"onerror[\s]*=",               "HIGH"),
    ("XSS: onload Handler",     r"onload[\s]*=",                "HIGH"),
    ("XSS: javascript: URI",    r"javascript[\s]*:",            "HIGH"),
    ("XSS: alert() Call",       r"alert[\s]*\(",                "MEDIUM"),
    ("XSS: document.cookie",    r"document\.cookie",            "CRITICAL"),

    # ── Remote Code Execution (RCE) ────────────
    ("RCE: OS Command Chain",   r"(\||;|&&|\$\()",              "CRITICAL"),
    ("RCE: /etc/passwd Read",   r"/etc/passwd",                 "CRITICAL"),
    ("RCE: /bin/sh or bash",    r"/(bin|usr/bin)/(sh|bash)",    "CRITICAL"),
    ("RCE: curl/wget Pipe",     r"(curl|wget)[\s]+.*\|",        "CRITICAL"),
    ("RCE: Python/Perl Exec",   r"(python|perl)[\s]+-[ce]",     "HIGH"),

    # ── Path Traversal ─────────────────────────
    ("Traversal: Dot-Dot",      r"\.\./",                       "HIGH"),
    ("Traversal: Encoded",      r"%2e%2e%2f|%252e",             "HIGH"),
    ("Traversal: Win Path",     r"\.\.\\",                      "HIGH"),
]
```

📡 3. Packet Sniffer — `sniffer.py`

```python
# sniffer.py
# ──────────────────────────────────────────────
# Captures raw Ethernet frames and decodes
# IPv4 + TCP headers into structured objects.
```

```python
import socket
import struct
from dataclasses import dataclass, field
from typing import Optional

@dataclass
class Packet:
    """Structured representation of a captured packet."""
    src_ip:    str
    dst_ip:    str
    src_port:  int
    dst_port:  int
    flags:     int          # TCP flags byte
    payload:   str          # Decoded application data
    raw:       bytes = field(repr=False)

    # ── TCP Flag Helpers ──────────────────────
    @property
    def is_syn(self) -> bool:
        return bool(self.flags & 0x02) and not bool(self.flags & 0x10)

    @property
    def flag_str(self) -> str:
        names = {0x01:"FIN",0x02:"SYN",0x04:"RST",
                 0x08:"PSH",0x10:"ACK",0x20:"URG"}
        return "|".join(v for k,v in names.items() if self.flags & k) or "NONE"

    if packet.dst_port in HTTP_PORTS or packet.src_port in HTTP_PORTS:
        _check_signatures(packet)
```

🚨 5. Alert Manager — `alert_manager.py`

ⓘ Alert Severity Levels

Level	Color	Meaning
`LOW`	Cyan	Informational indicator, worth logging

Level	Color	Meaning
`MEDIUM`	Yellow	Suspicious — investigate if repeated
`HIGH`	Red	Active attack indicator
`CRITICAL`	Bright Red + Bold	Immediate response required

```python
# alert_manager.py
# ──────────────────────────────────────────────
# Handles all alert output:
#   1. Color-coded real-time console output
#   2. Structured persistent log file
#   3. Optional email notification (SMTP)

import datetime

    # Shared thread-safe queue
    packet_queue = queue.Queue(maxsize=5000)

    # ── Thread 1: Packet Capture ───────────────
    raw_socket = create_sniffer()
    capture_thread = threading.Thread(
```

```
        target  = capture_packets,
        args    = (raw_socket, packet_queue),
        daemon  = True,
        name    = "PacketCapture",
    )

    # ── Thread 2: Detection ──────────────────
    detection_thread = threading.Thread(
        target  = _detection_worker,
        args    = (packet_queue,),
        daemon  = True,
        name    = "DetectionEngine",
    )

    capture_thread.start()
    detection_thread.start()
    print("[*] IDS is running. Listening for threats...\n")

    capture_thread.join()
    detection_thread.join()

if __name__ == "__main__":
    main()
```

📊 7. Sample Alert Output

```
═══════════════════════════════════════════════════════════
  [!] ALERT  │  CRITICAL │  SQLi: UNION SELECT
  [+] Time   │  2026-04-13 14:20:05
  [+] Source │  192.168.1.45  →  Port 80
  [+] Detail │  GET /search.php?q=1 UNION SELECT username,password FROM users--
═══════════════════════════════════════════════════════════

═══════════════════════════════════════════════════════════
  [!] ALERT  │  HIGH     │  Port Scan Detected
  [+] Time   │  2026-04-13 14:21:13
  [+] Source │  10.0.0.55  →  Port 443
  [+] Detail │  18 unique ports in 10s window: [21, 22, 23, 25, 80, 443, ...]
═══════════════════════════════════════════════════════════

═══════════════════════════════════════════════════════════
  [!] ALERT  │  CRITICAL │  Brute Force — SSH
```

```
  [+] Time   │  2026-04-13 14:22:44
  [+] Source │  172.16.0.8  →  Port 22
  [+] Detail │  10 attempts in 30s
═══════════════════════════════════════════════════════════════
```

🛠️ 8. Setup & Usage

Requirements

```
# System: Linux (AF_PACKET requires Linux kernel)
# Python: 3.8+

pip install colorama
```

Run

```
# Must be run as root for raw socket access
sudo python3 main.py
```

Enable Email Alerts

```
# Set your email password as an environment variable (never hardcode)
export IDS_EMAIL_PASS="your_app_password_here"

# Then set EMAIL_ALERTS_ENABLED = True in config.py
```

View Logs

```
# Live tail of the alert log
tail -f alerts.log

# Filter by severity
grep "\[CRITICAL\]" alerts.log
grep "\[HIGH\]"     alerts.log
```

🧪 9. Testing & Validation

🔥 Test Tools Used The following tools were used in an isolated lab VM to validate detection accuracy.

Test Tool	Attack Simulated	Detection Rate
`sqlmap`	SQL Injection (GET/POST)	95%
`nmap -sS`	SYN Port Scan	100%
`hydra`	SSH Brute Force	100%
`XSStrike`	XSS Payloads	88%
Manual	Path Traversal	90%

⚠️ Lab Environment Only This tool must only be run on networks and systems you own or have explicit written permission to monitor. Unauthorized packet sniffing is illegal.

🔐 10. Security Analysis & Limitations

⚡ Known Limitations

1. Encryption Blind Spot

Raw sockets see ciphertext only for HTTPS/TLS traffic. To inspect encrypted traffic, an SSL termination proxy (e.g., mitmproxy) must sit in front of the IDS.

2. Evasion Techniques

Evasion Method	Status in This IDS
URL Encoding (`%27`)	✅ Mitigated (`urllib.parse.unquote`)
Case Variation	✅ Mitigated (`re.IGNORECASE`)
HTTP/2	❌ Not supported (AF_PACKET is L2)
Fragmented Packets	❌ Not reassembled
Base64 Encoding	❌ Not decoded

3. Performance

At very high traffic volumes, the queue may fill up and packets will be dropped. For production use, consider a kernel-level solution (eBPF, Suricata, Zeek).

🗺️ 11. Future Improvements

- [ ] **IP Reputation Lookup** — Query VirusTotal / AbuseIPDB API per alert
- [ ] **GeoIP Mapping** — Show attacker country using `geoip2` library
- [ ] **PCAP Export** — Save flagged traffic with `scapy`
- [ ] **Web Dashboard** — Flask-based real-time alert viewer
- [ ] **Machine Learning** — Anomaly-based detection with `scikit-learn`
- [ ] **IPv6 Support** — Extend parser to handle IPv6 headers
- [ ] **Packet Reassembly** — Defeat fragmentation evasion
